Year & Department: [YEAR — DEPARTMENT]

Project: Smart Restaurant Management System

- Dishes change after guests choose
- Kitchen updates reach staff late
- Tables, queues & bills are fragmented
- Stock and menu availability drift
- Managers spot bottlenecks too late

Proposed Solution

- One shared restaurant state
- Recipe-aware live availability
- Guest → kitchen → waiter flow
- Tables, queue, billing & inventory
- Forecasts + operations copilot

TECHNICAL APPROACH

- Next.js 16 + React 19 + TypeScript
- Supabase Auth + membership roles
- D1 versioned state + audit trail
- Recipe, order, queue & billing engine
- Gemini adapter + local fallback

ROLE INTERFACES

Guest • Kitchen • Waiter • Manager

NEXT.JS APPLICATION + DOMAIN ENGINE

AuthZ • Orders • Recipes • Queue • Billing

D1 STATE + SUPABASE AUTH

Version checks • Audit trail • Membership roles

Deterministic operations remain authoritative

Use Cases & Impact

- Guest: know what is available
- Kitchen: safer, timed tickets
- Waiter: prioritized service
- Manager: live control
- Measures waits, delays & stockouts

Future Scope & Conclusion

- Verify production auth
- Tenant-isolated onboarding
- Payments, suppliers, notifications
- Predictive multi-location operations
- One intelligent restaurant OS
